OCA16. Anotácia výstupu v anglickom jazyku / Annotation of the output in English <sup>9</sup> Rozsah do 200 slov / Range up to 200 words	Spruce bark represents a reservoir of bioactive compounds. The aim of this study was to investigate the effect of independent variables (temperature, liquid to solid ratio, time and methanol content) and their interaction within the extraction process by the response surface methodology (RSM). The effect of conventional (solvent extraction; SE) and modern (ultrasound-assisted extraction; UAE) methods for the extraction of antioxidants (antioxidant capacity; AC) and polyphenols (total polyphenol content; TPC) was compared. Maximum yields of AC and TPC by SE and UAE were obtained at modified optimal conditions of 63 °C, methanol content of 53 % (v/v) and 38 mL of extraction solvent per gram of dry material. Two-step extraction process consisting of the fast washing and slow diffusion steps was suitable described by Peleg and Patricelli mathematic models. The HPLC fingerprints of both extracts did not show significant differences while the content of phenolic compounds extracted by UAE was 1.1- to 7.1-times higher than that obtained by SE, quantified by HPLC.

	OCA16. Anotácia výstupu v anglickom jazyku / Annotation of the output in English <sup>9</sup> Rozsah do 200 slov / Range up to 200 words	Laccases (E.C. 1.10.3.2) produced by white-rot fungi (WRF) can be widely used, but the high cost prevents their use in large-scale industrial processes. Finding a solution to the problem could involve laccase production by solid-state fermentation (SSF) simulating the natural growth conditions for WRF. SSF offers several advantages over conventional submerged fermentation (SmF), such as higher efficiency and productivity of the process and pollution reduction. The aim of this review is therefore to provide an overview of the current state of knowledge about the laccase production by WRF under SSF conditions. The focus is on variations in the up-stream process, fermentation and down-stream process and their impact on laccase activity. The variations of up-stream processing involve inoculum preparation, inoculation of the medium and formulation of the propagation and production media. According to the studies, the production process can be shortened to 5–7 days by the selection of a suitable combination of lignocellulosic material and laccase producer without the need for any additional components of the culture medium. Efficient laccase production was achieved by valorisation of wastes as agro-food, municipal wastes or waste generated from wood processing industries. This leads to a reduction of costs and an increase in competitiveness compared to other commonly used methods and/or procedures. There will be significant challenges and opportunities in the future, where SSF could become more efficient and bring the enzyme production to a higher level, especially in new biorefineries, bioreactors and biomolecular/genetic engineering.

	OCA16. Anotácia výstupu v anglickom jazyku / Annotation of the output in English <sup>9</sup> Rozsah do 200 slov / Range up to 200 words	The accumulation of polyhydroxyalkanoates (PHAs) by microorganisms usually occurs in response to environmental stress conditions. Therefore, it is advantageous to choose two-step cultivation. The first phase is aimed at maximizing biomass production, and only in the second phase, after setting the suitable conditions, PHA production starts. The aim of this work was to optimize the composition of the minimal propagation medium used for biomass production of <i>Cupriavidus necator</i> DSM 545 using the response surface methodology (RSM). Based on the results from the search for optimization limits, the glucose concentration, the ammonium sulfate concentration and the phosphate buffer molarity were chosen as independent variables. The optimal values were found as follows: the glucose concentration 10.8 g/L; the ammonium sulfate concentration 0.95 g/L; and the phosphate buffer molarity 60.2 mmol/L. The predicted biomass concentration was 4.54 g/L, and the verified value was at 4.84 g/L. Although this work was primarily focused on determining the optimal composition of the propagation medium, we also evaluated the optimal composition of the production medium and found that the optimal glucose concentration was 6.7 g/L; the ammonium sulfate concentration 0.60 g/L; and the phosphate buffer molarity 20 mmol/L. The predicted PHB yield was 54.7% (w/w) of dry biomass, and the verified value was 49.1%.

	OCA18. Charakteristika dopadu výstupu na spoločensko-hospodársku prax / Characteristics of the output's impact on socio-economic practice Rozsah do 200 slov v slovenskom jazyku / Range up to 200 words in Slovak Rozsah do 200 slov v anglickom jazyku / Range up to 200 words in English	Táto štúdia má významný dopad na biotechnologickú výrobu biologicky odbúrateľných plastov (PHA). Optimalizácia kultivačných podmienok pre <i>Cupriavidus necator</i> DSM 545 umožňuje efektívnejšiu produkciu biomasy a PHA, čo môže znížiť výrobné náklady a zvýšiť výťažnosť. To podporuje udržateľné riešenia v priemysle plastov, čím sa znížuje závislosť od fosílnych zdrojov. Z ekonomickeho hľadiska môžu optimalizované procesy prispieť k šíříemu využitiu PHA v komerčných aplikáciách, ako sú obaly či medicínske materiály. Spoločenský dopad spočíva v podpore ekologických alternatív k syntetickým plastom, čo môže viesť k zníženiu plastového odpadu a environmentálnej záťaže.

	<p>This study has important implications for the biotechnological production of biodegradable plastics (PHAs). Optimization of culture conditions for <i>Cupriavidus necator</i> DSM 545 allows for more efficient production of biomass and PHAs, which can reduce production costs and increase yields. This promotes sustainable solutions in the plastics industry, reducing dependence on fossil resources. From an economic point of view, optimised processes can contribute to the wider use of PHA in commercial applications such as packaging or medical materials. The societal impact lies in the promotion of environmentally friendly alternatives to synthetic plastics, which can lead to a reduction in plastic waste and the burden on the environment.</p>

	OCA16. Anotácia výstupu v anglickom jazyku / Annotation of the output in English <sup>9</sup> Rozsah do 200 slov / Range up to 200 words	Microorganisms and plants can be important sources of many compounds with potential pharmaceutical applications. Extraction of these matrices is one of the ways of identifying the presence of inhibitory active substances against enzymes whose high activity leads to serious human diseases including cancer, Parkinson's or Crohn's diseases. The isolation and purification of inhibitors are time-consuming and expensive steps in the analysis of the crude extract and therefore, it is necessary to find a fast, efficient, and inexpensive method for screening extracts of interest. TLC-Bioautography combines the separation of the extract on a thin layer with its subsequent biological analysis. TLC-Bioautography methods have been developed for several classes of enzymes including oxidoreductases, hydrolases and isomerases, and there is a potential for developing functional methods for other classes of enzymes. This review summarizes known TLC-Bioautography methods and their applications for determining the presence of enzyme inhibitors in extracts and compares the effectiveness of different methodological approaches. It also indicates the current state and perspective of the development of TLC-Bioautography and its possible future applications.

	OCA18. Charakteristika dopadu výstupu na spoločensko-hospodársku prax / Characteristics of the output's impact on socio-economic practice  <sup>10</sup> Rozsah do 200 slov v slovenskom jazyku / Range up to 200 words in Slovak <sup>11</sup> Rozsah do 200 slov v anglickom jazyku / Range up to 200 words in English	Enzýmy sú často cieľom aplikácie farmaceutík používaných na liečenie rôznych ochorení. Na tento účel sa používajú inhibítory patriace tak do skupiny synteticky pripravených látok ako aj do skupiny prírodných látok, ktoré je veľmi ľahké identifikovať v hrubých extraktoch donorovaných matíc (predovšetkým mikroorganizmov a rastlín). Na uľahčenie identifikácie týchto látok je možné využiť viaceré techniky, medzi ktoré patrí aj TLC bioautografia. Predmetný článok bol zameraný na prieskum metodík pre identifikáciu inhibitorov enzýmov, potenciálne pôsobiaciach ako spôsobe ochorení, Enzymes are often the target of pharmaceutical applications used to treat various diseases. For this purpose, inhibitors belonging to the group of synthetically prepared substances as well as to the group of natural substances, which are very difficult to identify in crude extracts of donor matrices (mainly micro-organisms and plants), are used. Several techniques, including TLC bioautography, can be used to facilitate the identification of these substances. The present paper was aimed at investigating

	methodologies for the identification of enzyme inhibitors potentially acting as disease trigger
OCA19. Charakteristika dopadu výstupu a súvisiacich aktivít na vzdelávací proces / Characteristics of the output and related activities' impact on the educational process <i>Rozsah do 200 slov v slovenskom jazyku / Range up to 200 words in Slovak</i> <i>Rozsah do 200 slov v anglickom jazyku / Range up to 200 words in English</i>	Výstup je orientovaný do problematiky enzymológie, pričom táto práca sa stala podkladom pre rozšírenie metodických postupov cvičených v rámci laboratórnych cvičení, v ktorých je možné využiť enzým ako bioanalytické čnidlo umožňujúce nájsť potenciálne využiteľné, farmakologicky významné látky v hrubých extraktoch rastlín. Dopady sa prejavia vo výučbe predmetov s biotechnologickým a biologickým obsahom. The output is focused on the issue of enzymology, and this work became the basis for the expansion of methodological procedures practiced in laboratory exercises, in which it is possible to use the enzyme as a bioanalytical agent to find potentially useful, pharmacologically important substances in crude plant extracts. Impacts will be reflected in the teaching of subjects with biotechnological and biological content.

	OCA16. Anotácia výstupu v anglickom jazyku / Annotation of the output in English <sup>9</sup> Rozsah do 200 slov / Range up to 200 words	The aim of this study was to determine the potential of white-rot fungi, namely <i>Pycnoporus cinnabarinus</i> , <i>Pleurotus ostreatus</i> and <i>Trametes hirsuta</i> , for the mono azo dye Allura Red AC (AR) removal from aqueous solutions. AR belongs to the hardly degradable xenobiotic associated with a neurotoxic effect on humans and animals. Our results suggested that degradation processes driven by the activity of laccases were not involved in the process of AR removal and the predominant mechanism of dye elimination was biosorption. The surface of fungal biomass was analyzed by Fourier transform infrared spectroscopy (FTIR) and Langmuir and Freundlich models of absorption isotherms were applied to describe the biosorption isotherms. Langmuir model fitted the equilibrium data better than Freundlich isotherm according to the corrected Akaike Information Criterion (AICc). From Langmuir model, dead biomass of <i>P. ostreatus</i> modified by heat was the most suitable biosorbent with the maximum sorption capacity of $118.3 \pm 9.9$ mg/g dried biomass. Obtained results suggest that biomass of white-rot fungi can be used as a suitable and low-cost biosorbent for the removal of azo dyes from contaminated waters.
